Description

NMS magnetostrictive level transmitters are ideal solutions for high accuracy measurements of clean fluids. Its high precision renders the NMS suitable for measurements of highest demand. Integrating the transmitter into a process control system is easy thanks to the intelligent signal processing and communication software as well as the wide of range of accessories offered.

Operating Principle

A float containing a magnetic disc moves along a guide tube with the specific magnetostrictive wire in it. A pulse generated by the electronics travels along the magnetostrictive wire.

At the point the pulse reaches the float's magnetic field, a torsion develops. Reflected from the torsion point, the pulse creates an acoustic wave that travels back along the wire.

The 4 ... 20 mA output of the transmitter is proportional to the elapsed time between the excitation and detection.

Applications

- Level measurement of liquids, with minimum 0.4 kg/dm^3 density
- Chemical industry
- Power plants
- Oil industry
- Water industry
- Chemicals, solvents, hydrocarbons
